Differentiable Manifolds §18. Diffferentiable *k*-Forms

Sichuan University, Fall 2022

Reminder (see Section 3)

Let V be a vector space (over \mathbb{R}). Set $n = \dim V$.

• A *k-covector* on V is an alternating *k*-linear map $f: V^k \to \mathbb{R}$,

$$f(v_{\sigma(1)},\ldots,v_{\sigma(k)}) = (\operatorname{sgn} \sigma)f(v_1,\ldots,v_n) \qquad \forall \sigma \in S_k.$$

- We denote by $A_k(V)$ the space of k-covectors on V.
- We have

$$A_0(V) = \mathbb{R}, \qquad A_1(V) = V^*, \qquad A_k(V) = \{0\}, \quad k \ge n+1.$$

Reminder (Wedge product; see Section 3)

• If $f \in A_k(V)$ and $g \in A_\ell(V)$, the wedge product $f \land g$ is the $(k + \ell)$ -covector in $A_{k+\ell}(V)$ defined by

$$(f \wedge g)(v_1, \dots, v_{k+\ell}) = \frac{1}{k!\ell!} \sum_{\sigma \in S_{k+\ell}} \operatorname{sgn}(\sigma) f(v_{\sigma(1)}, \dots, v_{\sigma(k)}) g(v_{\sigma(k+1)}, \dots, v_{\sigma(k+\ell)}).$$

• The wedge product $\wedge: A_k(V) \times A_\ell(V) \to A_{k+\ell}(V)$ is a bilinear map which is anti-commutative and associative, i.e.,

$$f \wedge g = (-1)^{k\ell} g \wedge f, \qquad f \wedge f = 0 \quad (k \text{ odd}),$$

 $(f \wedge g) \wedge h = f \wedge (g \wedge h).$

Reminder (Wedge products of 1-covectors; see Section 3)

• If $\alpha^1, \ldots, \alpha^k$ are 1-covectors, then

$$(\alpha^1 \wedge \cdots \wedge \alpha^k)(v_1, \dots, v_k) = \det \left[\alpha^i(v_j)\right], \quad v_i \in V.$$

• Let β^1, \ldots, β^k be k-covectors such that

$$eta^i = \sum_j \mathbf{a}^i_j lpha^j, \qquad ext{for some matrix } A = [\mathbf{a}^i_j] \in \mathbb{R}^{k imes k}.$$

$$\beta^1 \wedge \cdots \wedge \beta^k = (\det A)\alpha^1 \wedge \cdots \wedge \alpha^k.$$

Definition

 $\mathscr{I}_{k,n}$ is the set of ascending multi-indices $l=(i_1,\ldots,i_k)$ such that $1\leq i_1<\cdots< i_k\leq n$.

Reminder (Bases of k-covectors; see Section 3)

Let e_1, \ldots, e_n be a basis of V and let $\alpha^1, \ldots, \alpha^n$ be the dual basis of $V^* = A_1(V)$. For $I = (i_1, \ldots, i_k) \in \mathscr{I}_{k,n}$ set

$$\alpha^{I} = \alpha^{i_1} \wedge \cdots \wedge \alpha^{i_k}$$
.

• If $J=(j_1,\ldots,j_k)\in\mathscr{I}_{k,n}$ and $e_J=(e_{j_1},\ldots,e_{j_k})$, then

$$\alpha^I(e_J) = \delta^I_J.$$

- The k-covectors α^{l} , $l \in \mathcal{I}_{k,n}$, form a basis of $A_{k}(V)$.
- In particular dim $A_k(V) = \binom{n}{k}$ for $k \leq n$.

Facts

- Any linear map $F: V \to W$ gives rise to a linear map $F^*: A_k(W) \to A_k(V)$ defined by $F^*g(v_1, \ldots, v_k) = g(Fv_1, \ldots, Fv_k), \qquad g \in A_k(W), \ v_i \in V.$
- If $F:V \to W$ and $G:W \to Z$ are linear maps, then $(G \circ F)^* = F^* \circ G^*.$

Consequence

The construction $V \to A_k(V)$ is a (contravariant) functor from the category $\mathbf{Vect}_{\mathbb{R}}$ to itself.

Remark

- There is a another construction $V \to \Lambda^k(V)$ called k-th exterior power.
- This is a covariant functor on Vect_ℝ.
- We have $A_k(V) = \Lambda^k(V^*)$, so the space of k-covectors is often denoted $\Lambda^k(V^*)$.

Definition (Differential *k*-forms)

Let M be a smooth manifold.

- The space $A_k(T_pM)$ is denoted $\Lambda^k(T_p^*M)$.
- An element of $\Lambda^k(T_p^*M)$ is called a k-covector at p.
- A differential k-form (or a k-covector field) is the assignment for each $p \in M$ of a k-covector $\omega \in \Lambda^k(T_p^*M)$.

Remarks

- Differential k-forms are also called differential forms of degree k, or simply k-forms.
- **2** A differential form of degree $k = \dim M$ is also called a *top* form.

Definition

If ω is a differential k-form and X_1, \ldots, X_k are vector fields on M, we denote by $\omega(X_1, \ldots, X_k)$ the function on M defined by

$$\omega(X_1,\ldots,X_k)(p)=\omega_p((X_1)_p,\ldots,(X_k)_p), \qquad p\in M.$$

Proposition (Proposition 18.1)

Let ω be a differential k-form. For any vector fields X_1, \ldots, X_k and function h on M, we have

$$\omega(X_1,\ldots,hX_i,\ldots,X_k)=h\omega(X_1,\ldots,X_k).$$

Example

Let (U, x^1, \dots, x^n) be a chart for M.

- If $p \in U$, then $\{\partial/\partial x^1|_p, \dots, \partial/\partial x^n|_p\}$ is a basis of T_pM .
- The dual basis of T_p^*M is $\{(dx^1)_p, \dots, (dx^n)_p\}$.
- For $I = (i_1, \dots, i_k) \in \mathscr{I}_{k,n}$ let dx^I be the k-form defined by $(dx^I)_p = (dx^{i_1})_p \wedge \dots \wedge (dx^{i_k})_p, \qquad p \in U.$

By the results of Section 3 (see slide 5) $\{(dx^I)_p; I \in \mathscr{I}_{k,n}\}$ is a basis of $\Lambda^k(T_p^*M)$ for every $p \in U$.

Local Expression for a k-Form

Facts

• Let $p \in U$. As $\{(dx^I)_p; I \in \mathscr{I}_{k,n}\}$ is a basis of $\Lambda^k(T_p^*M)$, every k-covector $\omega_p \in \Lambda^k(T_p^*M)$ can be uniquely written as

$$\omega_p = \sum_{I \in \mathscr{I}_{k,p}} a_I (dx^I)_p, \qquad a_I \in \mathbb{R}.$$

• Set $\partial_i = \partial/\partial x^i$ and for $I = (i_1, \dots, i_k) \in \mathscr{I}_{k,n}$ set $\partial_I = (\partial_{i_1}, \dots, \partial_{i_k})$. By the results of Section 3 (see slide 5):

$$dx^I(\partial_J)=\delta_J^I.$$

It follows that if $\omega_p = \sum_{I \in \mathscr{I}_{k,p}} a_I (dx^I)_p$, then $a_I = \omega_p(\partial_I)$.

ullet In particular, every k-form ω on U can be uniquely written as

$$\omega = \sum_{I \in \mathscr{I}_{k,n}} \mathsf{a}_I \mathsf{d} \mathsf{x}^I \qquad \text{with } \mathsf{a}_I = \omega(\partial_I).$$

Local Expression for a k-Form

Proposition (Proposition 18.3)

Suppose that $(U, x^1, ..., x^n)$ is a chart for M, and let $f^1, ..., f^k$ be smooth functions on U. Then

$$df^1 \wedge \cdots \wedge df^k = \sum_I \frac{\partial (f^1, \dots, f^k)}{\partial (x^{i_1}, \dots, x^{i_k})} dx^I.$$

Remark

In fact, in the same way as in Section 3 (see slide 4), we have

$$ig(df^1 \wedge \dots \wedge df^kig)(\partial_I) = \det ig[df^i(\partial_{i_j})ig] = \det ig[\partial f^i/\partial x^{i_j}ig] = rac{\partial (f^1,\dots,f^k)}{\partial (x^{i_1},\dots,x^{i_k})}.$$

Local Expression for a k-Form

Example

Let (V, y^1, \dots, y^n) be another chart. Then on $U \cap V$ we have

$$dy^{J} = \sum_{I} \frac{\partial (y^{j_1}, \dots, y^{j_k})}{\partial (x^{i_1}, \dots, x^{i_k})} dx^{I}.$$

Corollary (Corollary 18.4)

Suppose that $(U, x^1, ..., x^n)$ is a chart for M, and let $f, f^1, ..., f^n$ be smooth functions on U. Then

$$df = \sum_{i} \frac{\partial f}{\partial x^{i}} dx^{i},$$

$$df^{1} \wedge \dots \wedge df^{n} = \frac{\partial (f^{1}, \dots, f^{n})}{\partial (x^{1}, \dots, x^{n})} dx^{1} \wedge \dots \wedge dx^{n}.$$

The Bundle Point of View

Definition

• The k-th exterior power of the cotangent bundle is

$$\Lambda^k(T^*M) = \bigsqcup_{p \in M} \Lambda^k(T_p^*M) = \left\{ (p, \omega); \ p \in M, \ \omega \in \Lambda^k(T_p^*M) \right\}.$$

• The canonical map $\pi: \Lambda^k(T^*M) \to M$ is given by

$$\pi(p,\omega) = p, \qquad p \in M, \quad \omega \in \Lambda^k(T_p^*M).$$

The Bundle Point of View

Facts

Let $(U, \phi) = (U, x^1, \dots, x^n)$ be a chart for M. Set $V = \phi(U)$.

• Every k-covector $\omega_p \in \Lambda^k(T_p^*M)$ can be uniquely written as

$$\omega_p = \sum_I a_I (dx^I)_p, \quad \text{with } a^I = \omega_p(\partial_I).$$

• We thus get a natural bijection $\tilde{\phi}: \Lambda^k(T^*U) \to V \times \mathbb{R}^{\binom{n}{k}}$ such that, for all $p \in M$ and $\omega \in \Lambda^k(T_p^*M)$, we have

$$\tilde{\phi}(p,\omega) = ((x^i(p)), (\omega(\partial_I))).$$

Remark

In the same way as with the constructions of the tangent bundle TM and the cotangent bundle T^*M , the maps $\tilde{\phi}$ allow us to define a topology and a smooth structure on $\Lambda^k(T^*M)$.

The Bundle Point of View

Definition

Let (U, ϕ) be a chart for M and set $V = \phi(U)$. We endow $\Lambda^k(T^*U)$ with the topology such that

$$W \subset \Lambda^k(T^*U)$$
 is open $\iff \tilde{\phi}(W)$ is open in $V \times \mathbb{R}^{\binom{n}{k}}$.

Proposition

Let $\{(U_{\alpha}, \phi_{\alpha})\}$ be the maximal atlas of M.

Define

$$\mathscr{B} = \bigcup_{\alpha} \left\{ W; \ W \ \text{is an open in} \ \Lambda^k(T^*U_{\alpha}) \right\}.$$

Then \mathscr{B} is the basis for a unique topology on $\Lambda^k(T^*M)$.

- The collection $\{(T^*U_\alpha, \tilde{\phi}_\alpha)\}$ is a C^∞ atlas on $\Lambda^k(T^*M)$, and hence $\Lambda^k(T^*M)$ is a smooth manifold.
- $\Lambda^k(T^*M) \xrightarrow{\pi} M$ is a smooth vector bundle over M.

Remark

A k-form on M is a section of the exterior power $\Lambda^k(T^*M)$.

Definition

- We say that k-form is C^{∞} when it is C^{∞} as a section of $\Lambda^k(T^*M)$.
- We denote by $\Omega^k(M)$ the space of smooth k-forms on M.

Remarks

- In other words, $\Omega^k(M)$ is the space of smooth sections of T^*M . In particular, this is a module over the ring $C^{\infty}(M)$.
- **2** As $\Lambda^0(T_p^*M) = \mathbb{R}$, a 0-form is just a map from M to \mathbb{R} . Thus, a smooth 0-form is just a smooth function on M, i.e., $\Omega^0(M) = C^\infty(M)$.

Example

Let $(U, \phi) = (U, x^1, \dots, x^n)$ be a chart for M. Set $V = \phi(U)$.

- It can be shown that each k-form dx^{l} , $l \in \mathcal{I}_{k,n}$ is smooth.
- Thus, $\{dx^I; I \in \mathscr{I}_{n,k}\}$ is a smooth frame of $\Lambda^k(T^*M)$ over U.

Reminder (Proposition 12.2)

Let $\{s_1, \ldots, s_r\}$ be a C^{∞} frame of a vector bundle E over U. A section $s = \sum c^i s_i$ of E over U is smooth if and only if c^1, \ldots, c^r are smooth functions on U.

We immediately obtain:

Lemma (Lemma 18.6)

Let $(U, x^1, ..., x^n)$ be a chart for M. A k-form $\omega = \sum a_I dx^I$ on U is smooth if and only if the coefficients a_I are C^{∞} functions on U.

In the same way as with vector fields and 1-forms by using the previous lemma we obtain:

Proposition (Proposition 18.7; 1st part)

Let ω be a k-form on M. Then TFAE:

- \bullet is a smooth k-form.
- **2** M has an atlas such that, for every chart $(U, x^1, ..., x^n)$ of this atlas, we may write $\omega = \sum a_I dx^I$ on U with $a^I \in C^{\infty}(U)$.
- For every chart $(U, x^1, ..., x^n)$ of M, we may write $\omega = \sum a_I dx^I$ on U with $a^I \in C^{\infty}(U)$.

Proposition (Proposition 18.7; 2nd part)

Let ω be a k-form on M. Then TFAE:

- \bullet is a smooth k-form.
- **2** For any smooth vector fields X_1, \ldots, X_k on M, the function $\omega(X_1, \ldots, X_k)$ is smooth on M.

Proposition (Proposition 18.8)

Let τ be a smooth k-form defined on a neighborhood of p. Then there exists a smooth k-form $\tilde{\tau}$ on M which agrees with τ near p.

Pullback of k-Forms

Reminder (see slide 6)

Any linear $F: V \to W$ between vector spaces gives rise to a linear map $F^*: A_k(W) \to A_k(V)$ defined by

$$F^*g(v_1,\ldots,v_k)=g(Fv_1,\ldots,Fv_k), \qquad g\in A_k(W), \ v_i\in V.$$

Definition (Pullback of a k-form)

Let $F: N \to M$ be a smooth map. If ω is a k-form on M, then its pullback $F^*\omega$ is the k-form on N defined by

$$(F^*\omega)_p = (F_{*,p})^*\omega_{F(p)}, \qquad p \in N.$$

That is,

$$(F^*\omega)_p(v_1,\ldots,v_k)=\omega_p(F_{*,p}v_1,\ldots,F_{*,p}v_k), \qquad v_i\in T_pM.$$

Pullback of k-Forms

Proposition (Proposition 18.9)

Let $F: N \to M$ be a smooth map. If ω and τ are k-forms on M and a is a constant, then

$$F^*(\omega + \tau) = F^*\omega + F^*\tau,$$

$$F^*(a\omega) = aF^*\omega.$$

Remark

We will see later that if ω is a smooth k-form, then its pullback $F^*\omega$ is a smooth as well (see slide 29).

The Wedge Product

Definition

If ω is a k-form and τ is a ℓ -form on M, then their wedge product $\omega \wedge \tau$ is the $(k + \ell)$ -form on M defined by

$$(\omega \wedge \tau)_p = \omega_p \wedge \tau_p \in \Lambda^{k+\ell}(T_p^*M), \qquad p \in M.$$

Proposition (Proposition 18.10)

If ω and τ are smooth forms on M, then $\omega \wedge \tau$ is smooth on M.

Corollary

The wedge product induces an anti-commutative associative bilinear map,

$$\wedge: \Omega^k(M) \times \Omega^\ell(M) \longrightarrow \Omega^{k+\ell}(M).$$

The Wedge Product

Reminder (Graded Algebras)

• An algebra A over a field $\mathbb K$ is called graded when it can be decomposed as

$$A = \bigoplus_{k=0}^{\infty} A^k,$$

where the A^k are subspaces such that the multiplication maps $A^k \times A^\ell$ to $A^{k+\ell}$.

We say that A is anticommutative (or graded commutative) when

$$ba = (-1)^{k\ell}ab$$
 for all $a \in A^k$ and $b \in A^\ell$.

The Wedge Product

Proposition

Set $n = \dim M$. We Define

$$\Omega^*(M) = \bigoplus_{k=0}^n \Omega^k(M).$$

Then $\Omega^*(M)$ is anticommutative graded algebra under the wedge product.

Remark

 $\Omega^*(M)$ is called the *exterior algebra of differential forms* on M.

Wedge Product and Pullback

Proposition (Proposition 18.11)

Let $F: N \to M$ be a smooth map. If ω and τ are differential forms on M, then $F^*(\omega \wedge \tau) = (F^*\omega) \wedge (F^*\tau).$

This result is used to prove:

Lemma (Local expression for pullback)

Suppose that $F: N \to M$ is a smooth map. Let $(U, x^1, ..., x^n)$ be a chart for N and $(V, y^1, ..., y^m)$ a chart for M such that $U \subset F^{-1}(V)$. Set $F^j = y^j \circ F$. For any k-form $\omega = \sum b_J dy^J$ on V, we have

$$F^*\omega = \sum_{I,J} (b_J \circ F) \frac{\partial (F^{j_1}, \dots F^{j_k})}{\partial (x^{i_1}, \dots, x^{i_k})} dx^I \quad \text{on } U.$$

Wedge Product and Pullback

Proof.

• Thanks to Proposition 18.9, on $F^{-1}(V)$ we have

$$F^*\omega = F^*\big(\sum_J b_J y^J\big) = \sum_J F^*b_J F^*(dy^J) = \sum_J \big(b_J \circ F\big) F^*(dy^J).$$

• It remains to determine $F^*(dy^J)$. By Proposition 18.11,

$$F^*(dy^J) = F^*(dy^{j_1} \wedge \cdots \wedge dy^{j_k}) = (F^*dy^{j_1}) \wedge \cdots \wedge (F^*dy^{j_k}).$$

• By Proposition 17.10 pullback commutes with the differential:

$$(F^*dy^{j_\ell}) = d(F^*y^{j_\ell}) = d(y^{j_\ell} \circ F) = dF^{j_\ell}.$$

 \bullet Thus, on U we have

$$F^*(dy^J) = dF^{j_1} \wedge \cdots \wedge dF^{j_k} = \sum_{I} \frac{\partial \left(F^{j_1}, \dots F^{j_k}\right)}{\partial \left(x^{i_1}, \dots, x^{i_k}\right)} dx^I.$$

This gives the result.

Wedge Product and Pullback

By combining the previous lemma with the characterization of smoothness of k-forms (Proposition 18.7) we obtain:

Proposition (Proposition 19.7)

Let $F: \mathbb{N} \to M$ be a smooth map. If ω is a smooth k-form on M, then $F^*\omega$ is a smooth form on \mathbb{N} .

Remark

- In Tu's book the above result is proved in Section 19. The main step is to prove the previous lemma.
- However, Tu's proof uses Proposition 19.5 whose statement requires Proposition 19.7 in order to makes sense.
- Therefore, Proposition 19.5 cannot be used to prove Proposition 19.7.
- Tu's arguments are fine if we use Proposition 17.10 instead of Proposition 19.5 (as it is done in the previous slide).

Invariant Forms on a Lie Group

Definition

Let G be a Lie group. A k-form ω on G is left-invariant if

$$\ell_{g}^{*}\omega = \omega \qquad \forall g \in G,$$

where $\ell_g: G \to G$ is the left-multiplication by g.

Remark

The left-invariance condition means that

$$(\ell_g)_{*,x}^*(\omega_{gx}) = \omega_x \qquad \forall g, x \in G.$$

In particular, by substituting g for x and g^{-1} for g we get

$$\omega_{\mathsf{g}} = \left(\ell_{\mathsf{g}^{-1}}\right)_{*,\mathsf{g}}^*\left(\omega_{\mathsf{e}}\right) \qquad \forall \mathsf{g} \in \mathsf{G}.$$

Thus, ω is uniquely determined by ω_e .

Invariant Forms on a Lie Group

Remark

Any k-covector $\omega \in \Lambda^k(\mathcal{T}_e^*G)$ generates a left-invariant k-form $\tilde{\omega}$ defined by $\tilde{\omega}_g = \left(\ell_{g^{-1}}\right)_{*,g}^*(\omega), \qquad g \in G.$

Proposition (Proposition 18.14)

Every left-invariant k-form on G is smooth.

Consequence

Denote by $\Omega^k(M)^G$ the space of left-invariant k-forms on G. Then we have a linear isomorphism,

$$\Omega^k(G)^G \longrightarrow \Lambda^k(T_e^*G), \qquad \omega \longrightarrow \omega_e.$$

In particular, if $n = \dim G$, then $\Omega^k(G)^G$ has dimension $\binom{n}{k}$.

Differential Forms on \mathbb{S}^1

Proposition (Problem 18.8)

Let $F: \mathbb{N} \to M$ be a surjective submersion.

- The pullback by F gives rise to an injective linear map $F^*: \Omega^k(M) \to \Omega^k(N)$.
- This allows us to identify $\Omega^k(M)$ with a subspace of $\Omega^k(N)$.

Definition

- A function $f: \mathbb{R} \to \mathbb{R}$ is a 2π -periodic if $f(t+2\pi) = f(t)$.
- A 1-form f(t)dt on $\mathbb R$ is said to be 2π -periodic if the function f(t) is 2π -periodic.

Differential Forms on \mathbb{S}^1

Proposition (Proposition 18.12)

Let $h: \mathbb{R} \to \mathbb{S}^1$ be the map defined by

$$h(t) = (\cos t, \sin t).$$

Then:

- h is a surjective submersion.
- For k = 0, 1, under the pullback map $h^* : \Omega^k(\mathbb{S}^1) \to \Omega^k(\mathbb{R})$ the smooth k-forms on \mathbb{S}^1 corresponds to smooth 2π -periodic k-forms on \mathbb{R} .
